

An Improved Portable Auxiliary Vehicle/ Automobile Warning Device

Abstract

A warning device, and more particularly, an improved combination of message display when the driver of the vehicle is in distress. It is directed to an improved portable auxiliary vehicle/ automobile warning device capable of being installed/ deployed and/ or removably secured by the user by simply reaching out of the window to set the said device on the roof of the vehicle so that the user does not need to get out of the car and become injured from passing vehicles. This allows other automobiles to see the broken down vehicle to avoid collision.
